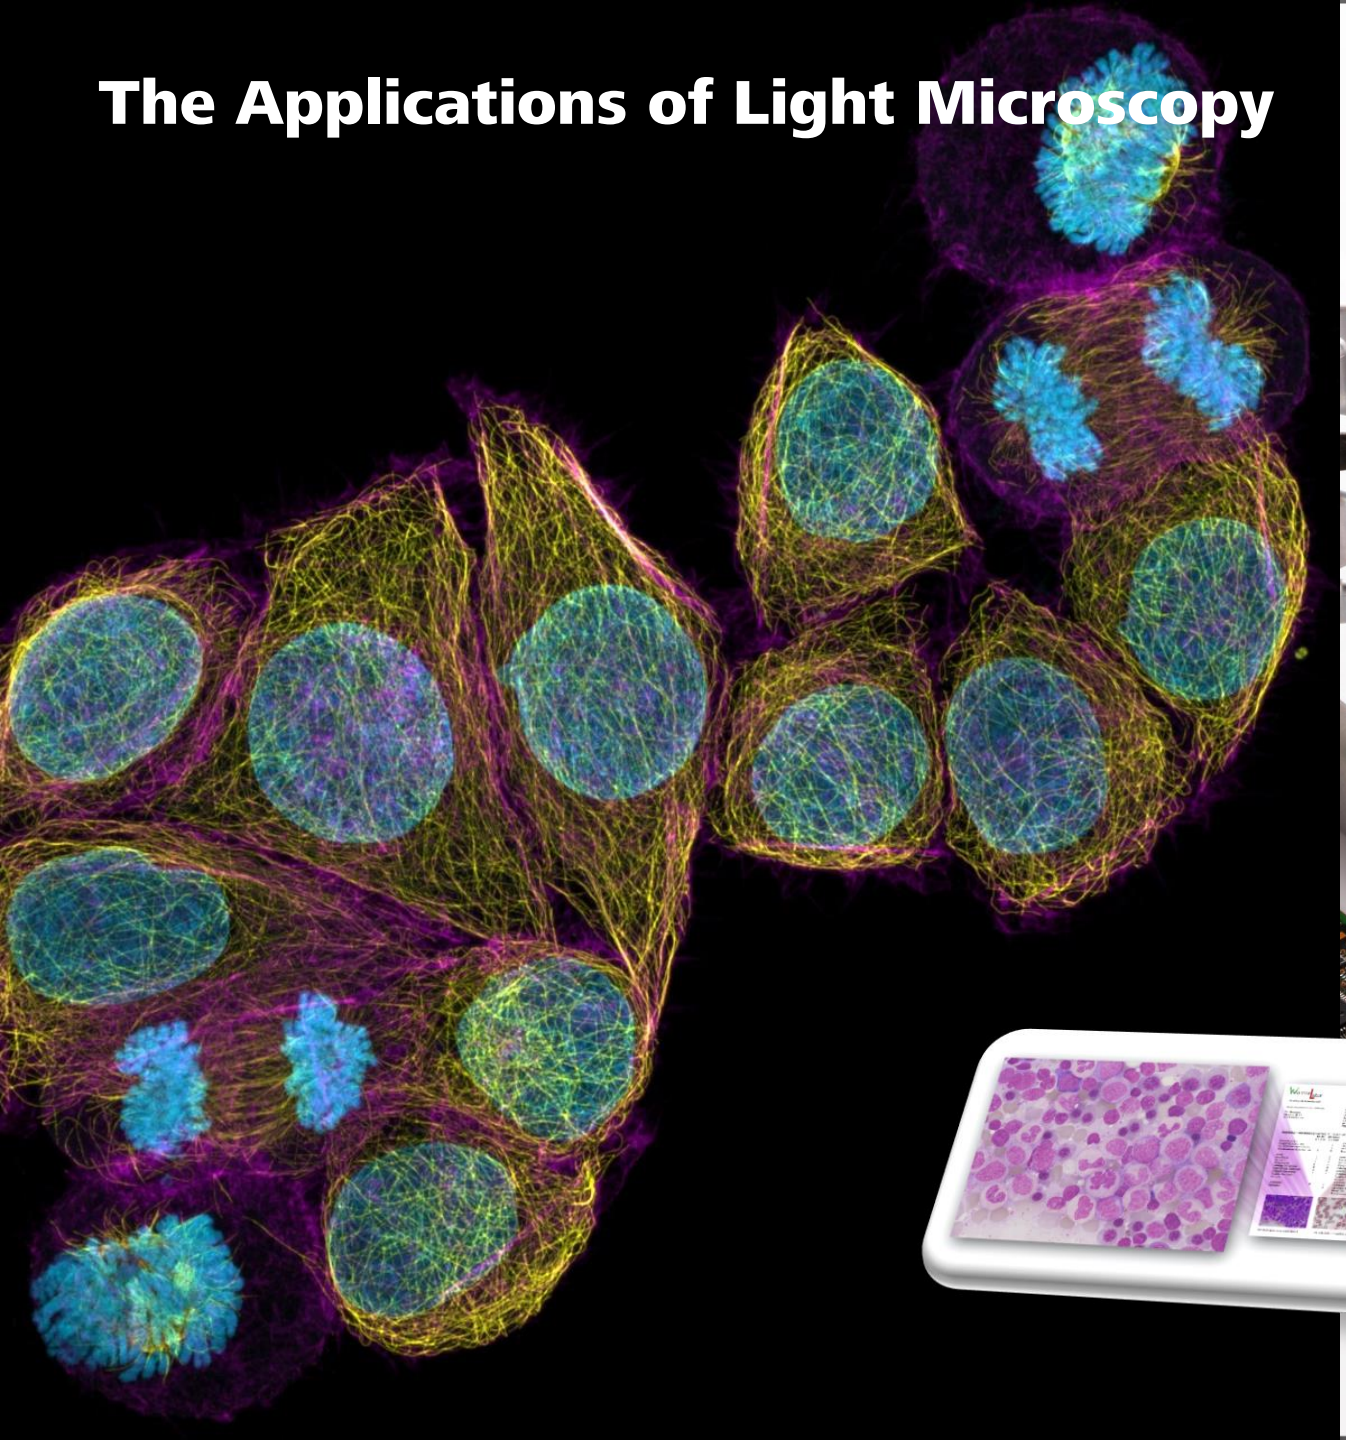
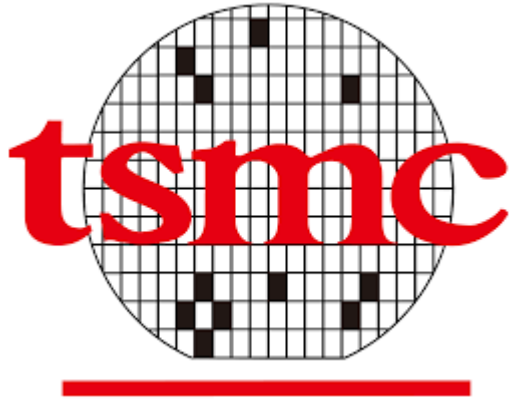
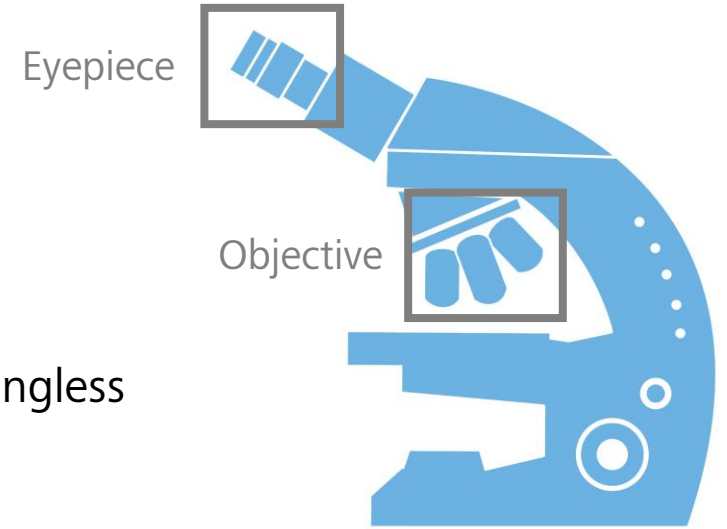
The Applications of Light Microscopy



The Applications of Light Microscopy

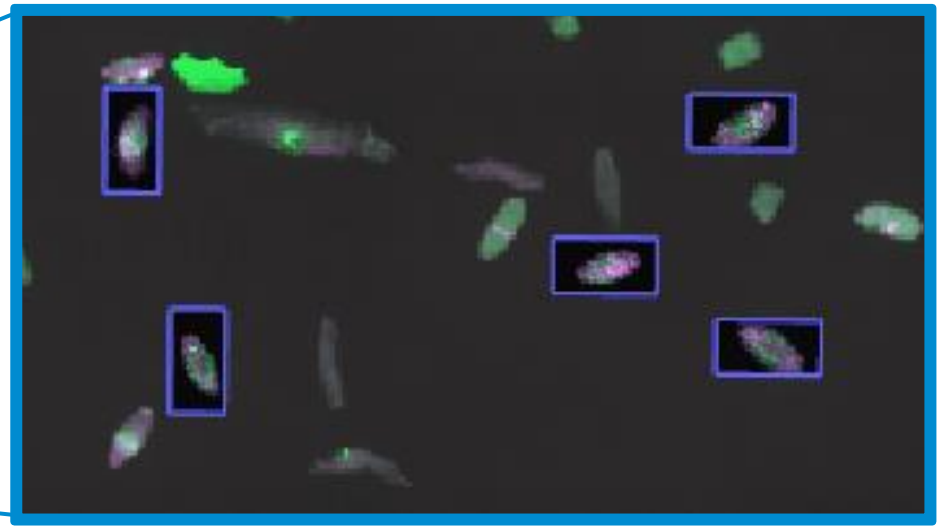


Magnification and Resolution



- Magnification? 100x? 1000x? 999999999x?
- Total magnification = **Objective** magnification x **Eyepiece** magnification

- **~1500x** is the limit of Light Microscopes, magnification above 1500x is meaningless
- Why?.



Magnification and Resolution

Magnification and Resolution

Magnification alone is not enough:

Resolution determines what we see.

Resolution of Your Eyes

Definition:

The resolution limit is reached, when two point-like objects can not be imaged as two distinct structures anymore.

The **distance** between the objects is called the resolution limit.

d = 10 cm

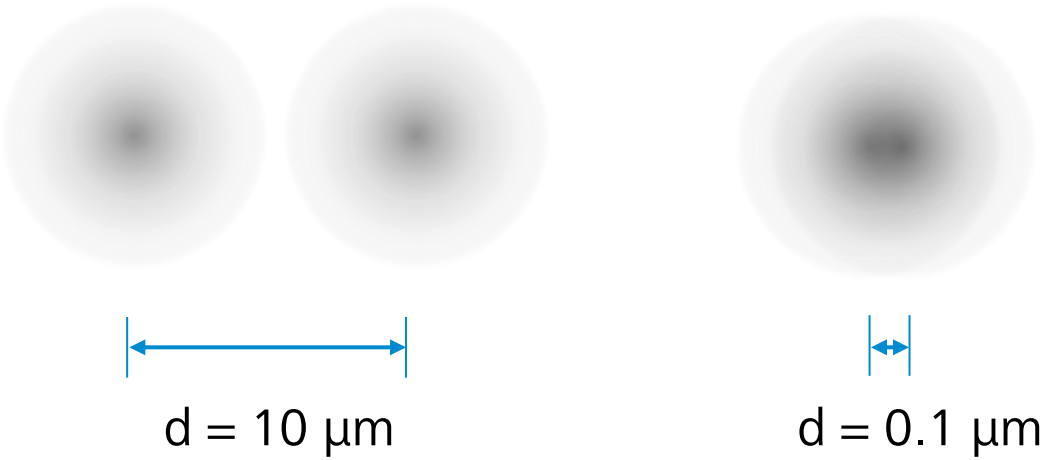
d = 0.1 cm

Resolution of Microscopes

Definition:

The resolution limit is reached, when two point-like objects can not be imaged as two distinct structures anymore.

The **distance** between the objects is called the resolution limit.



Diffraction Limited Resolution

Rayleigh criterion

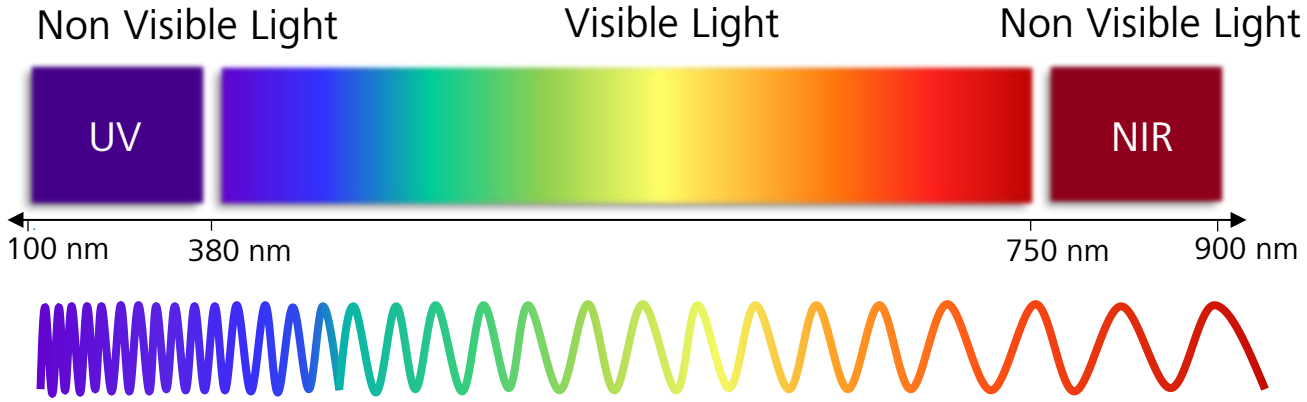
$$d_0 = \frac{1.22\lambda}{N.A_{obj.} + N.A._{Cond}}$$

or more simply

Abbe limit

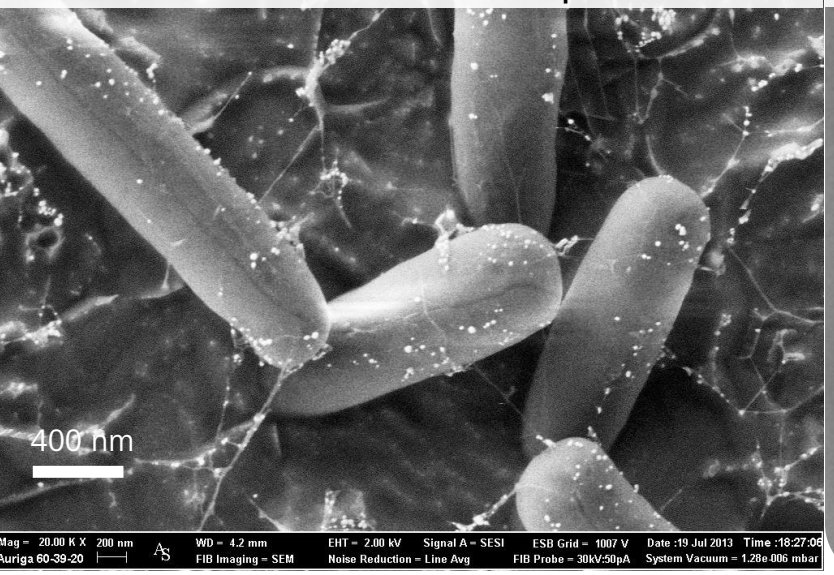
$$d_0 = \frac{\lambda}{2N.A}$$

λ = wavelength of light, e.g. 550 nm (green)

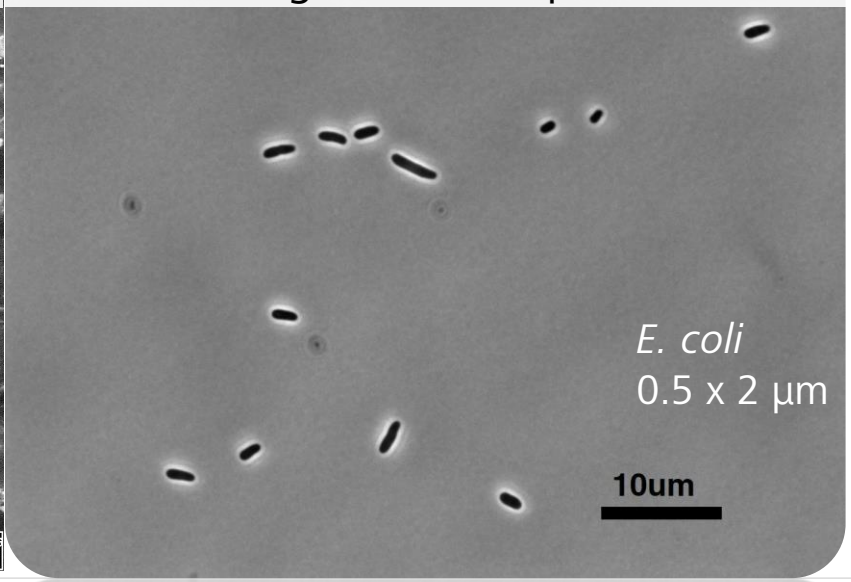


The resolution of light microscope **d_0= 200 ~ 300 nm**

Electron microscope



Light microscope



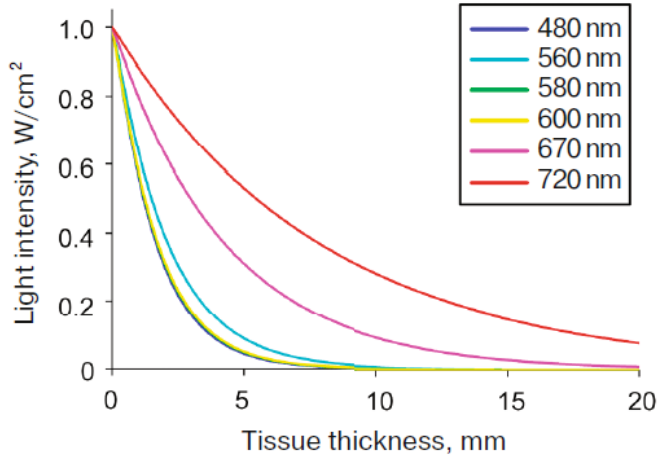


Image adapted from Karasev *et al.*, 2019

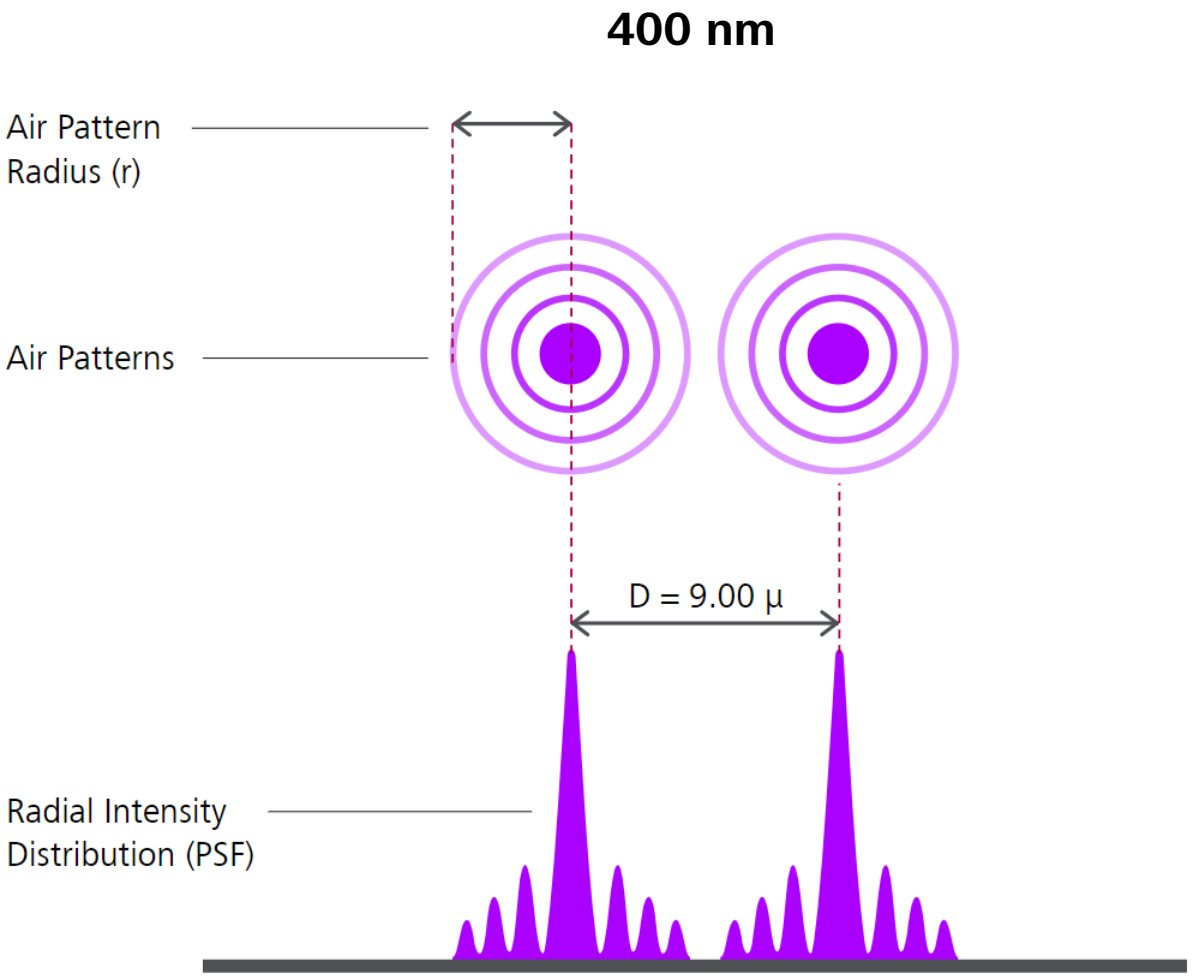
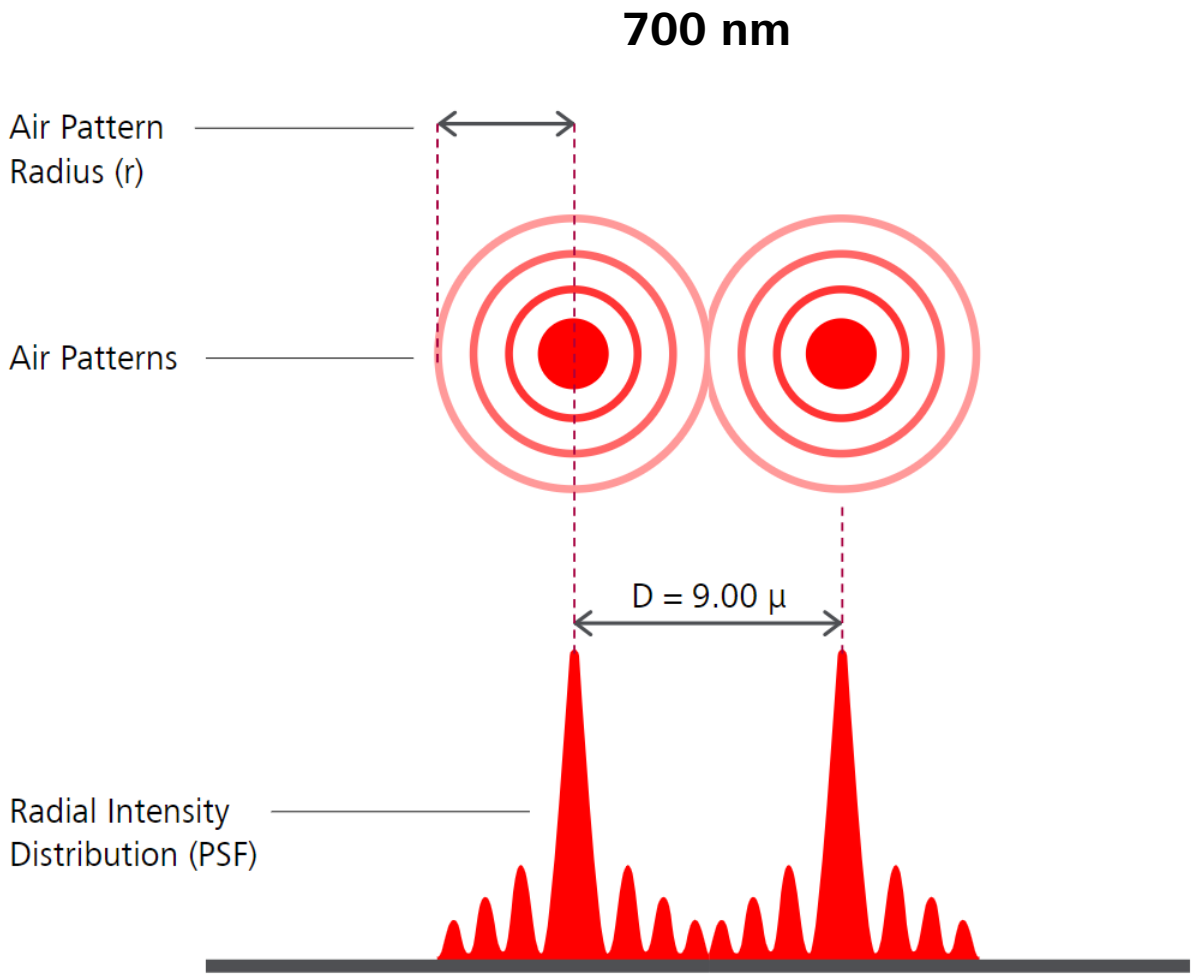
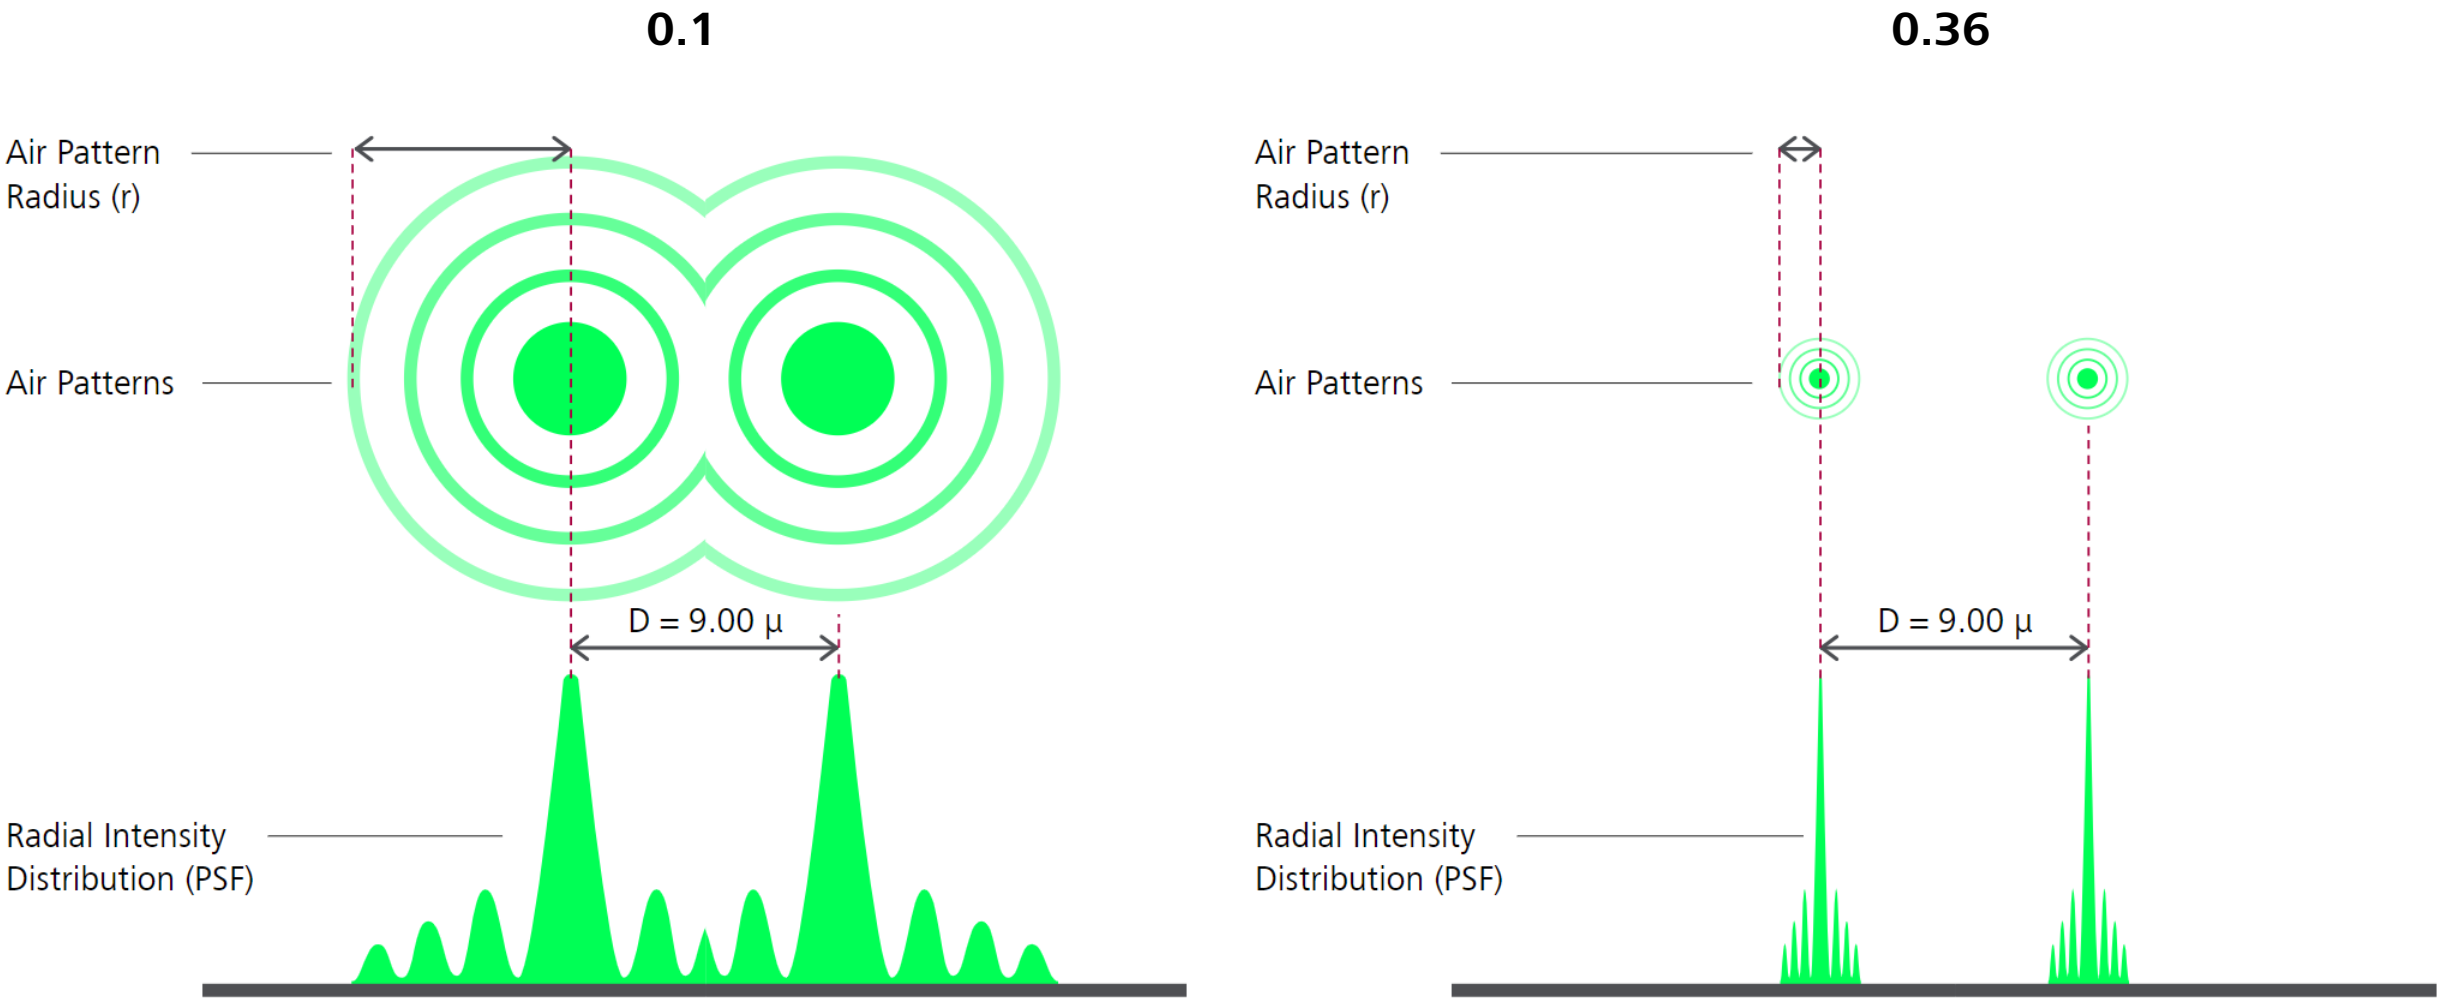
Longer wavelength being able to travel deeper into tissue

Resolution – Wavelength

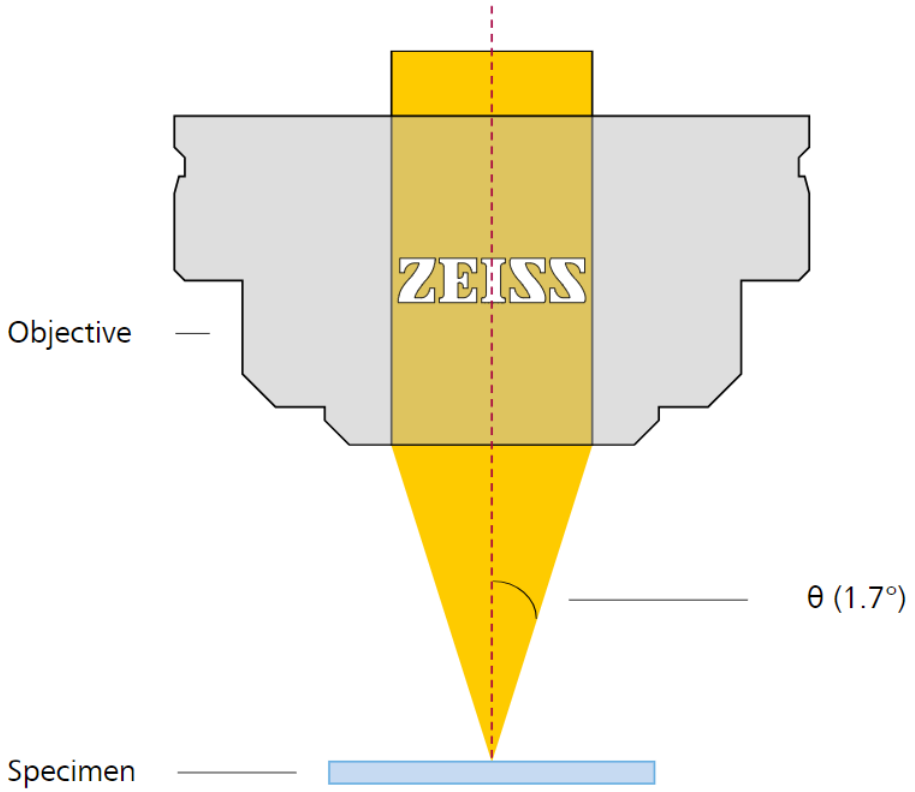




Resolution – N.A.



Resolution – N.A.



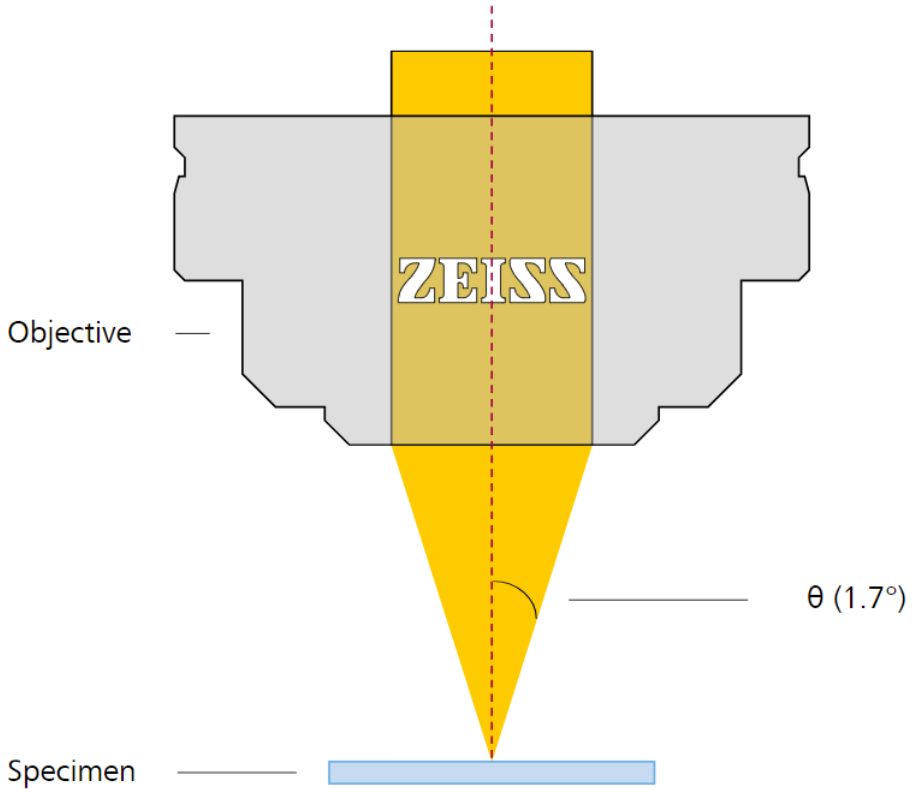
Numerical Aperture

Low ‹ › High

Numerical Aperture (NA) = n • sin θ

N.A. determines the brightness and resolution of an image formed by an objective

Resolution – N.A.

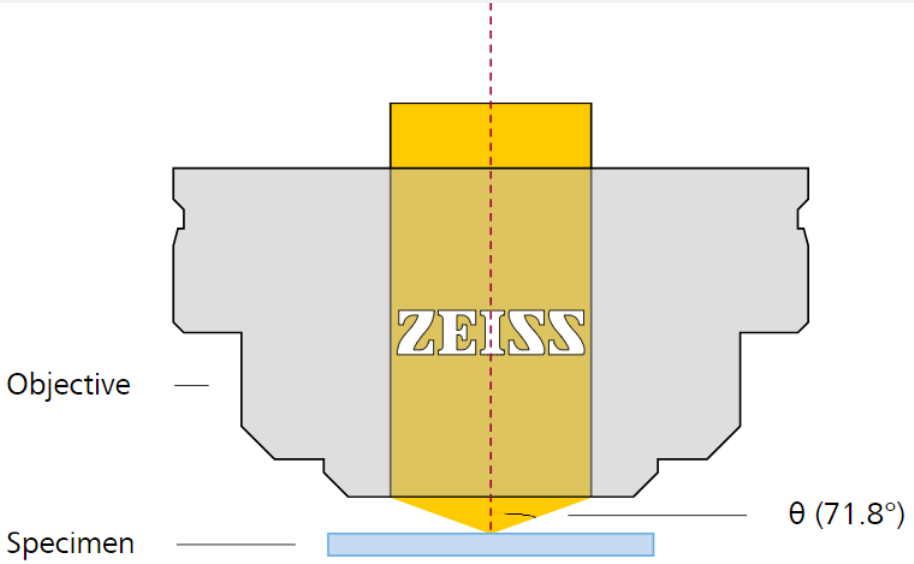


Numerical Aperture

Low ‹ › High

Higher NA offers

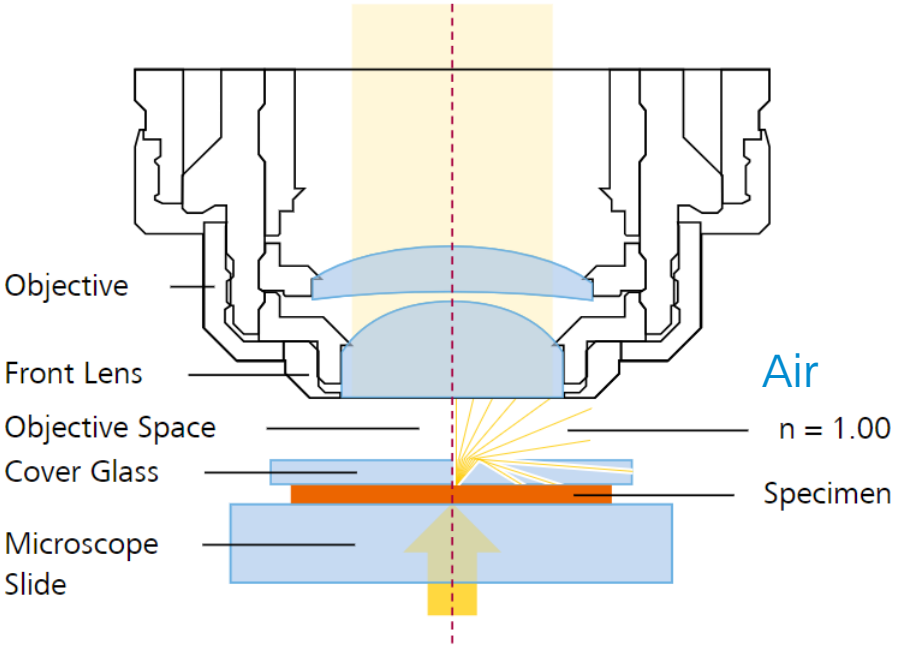
- 🙂 Better resolution & brighter image
- 🙁 Reduced working distance & sensitive to spherical aberration

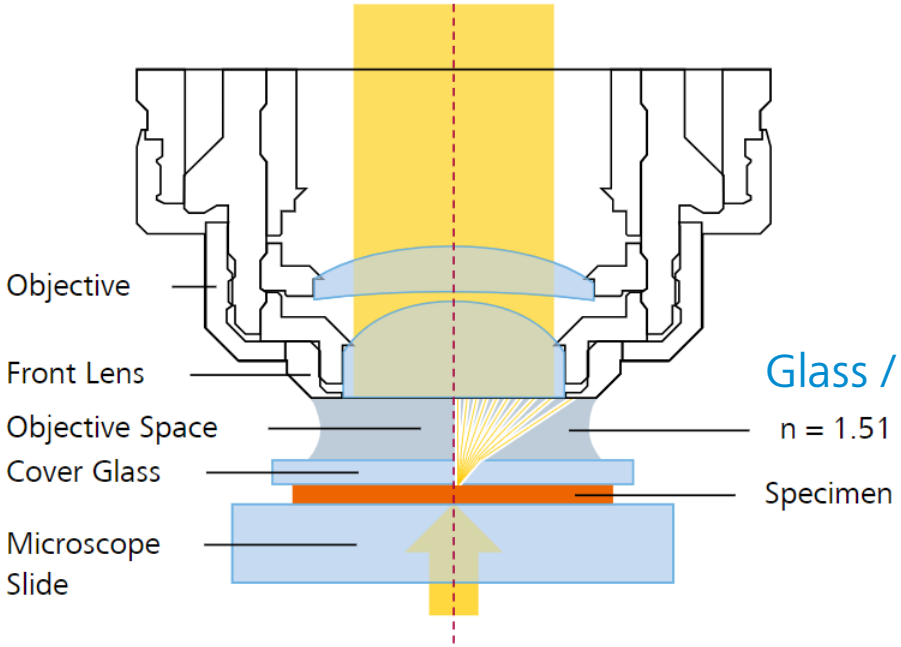


Numerical Aperture

Low ‹ › High

Immersion & Refractive Index





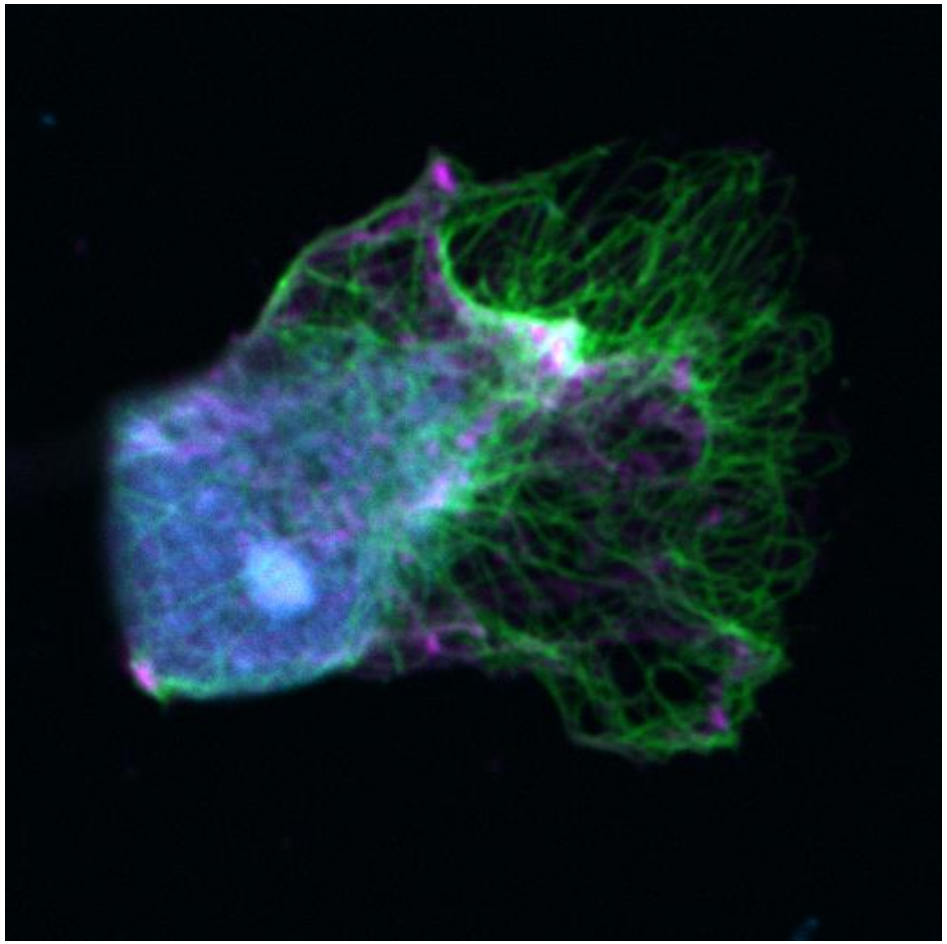
Refractive Index (n)

Low High

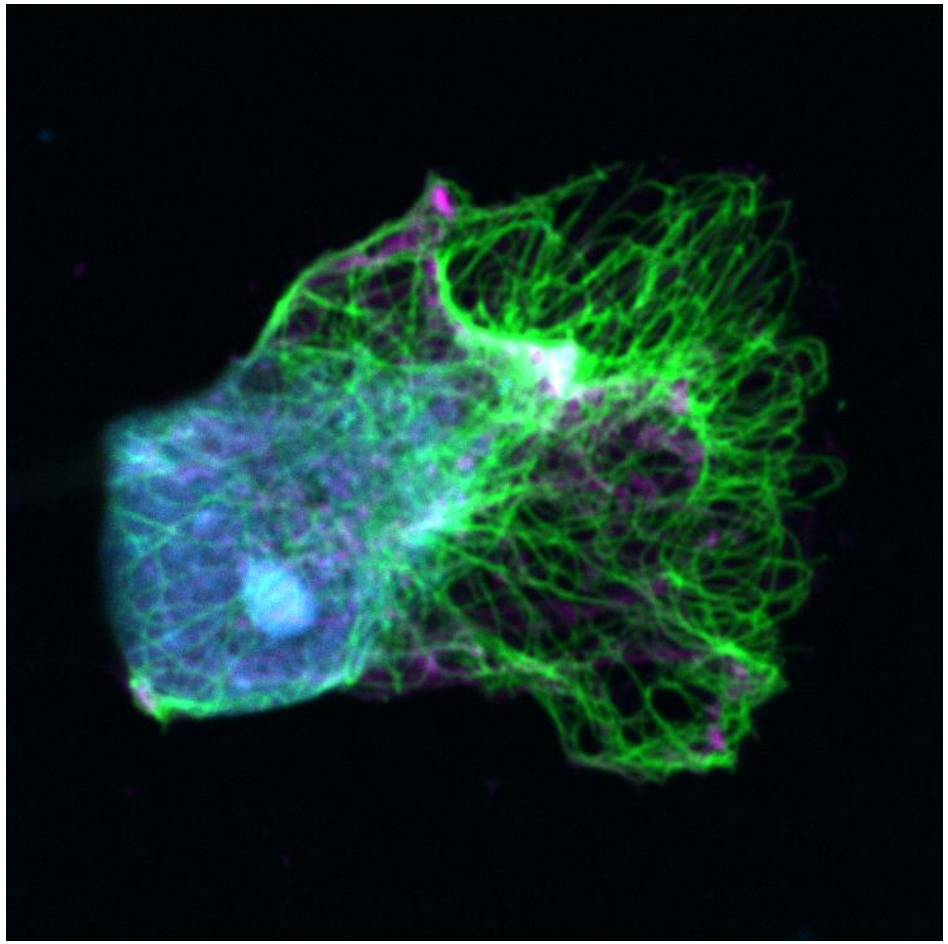
Refractive Index (n)

Low High

Higher NA + Immersion = Higher Resolution

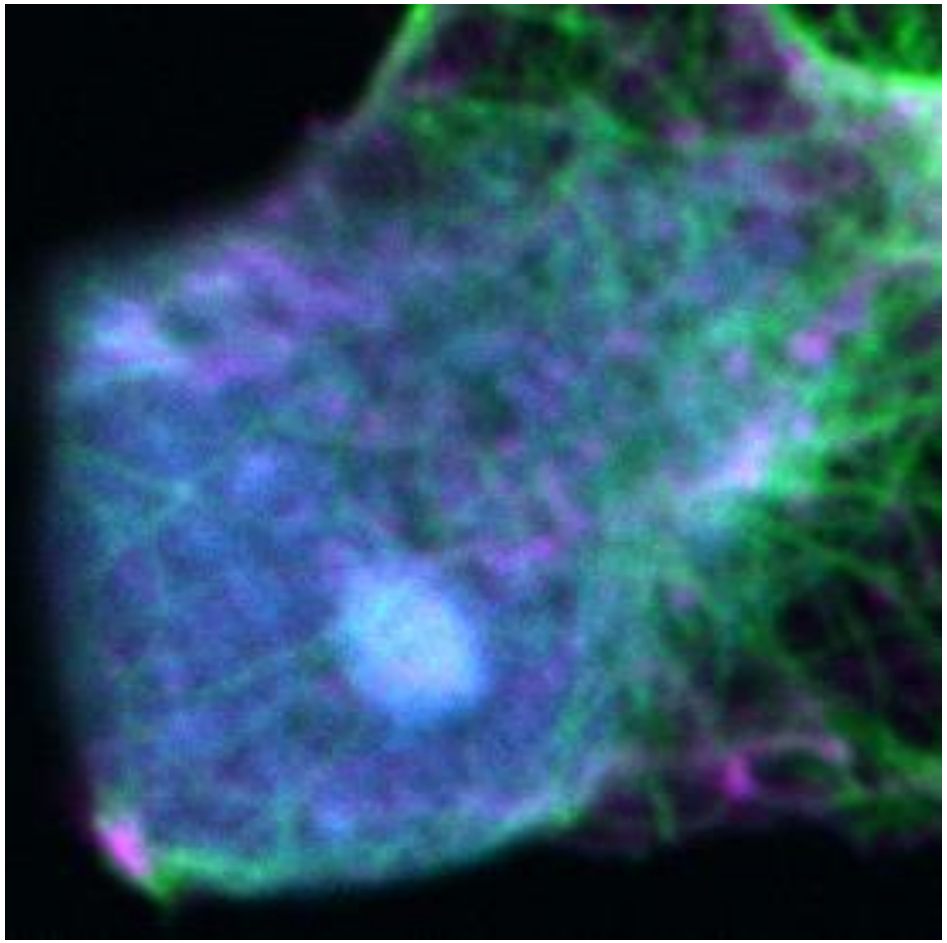


40x / 0.95 air

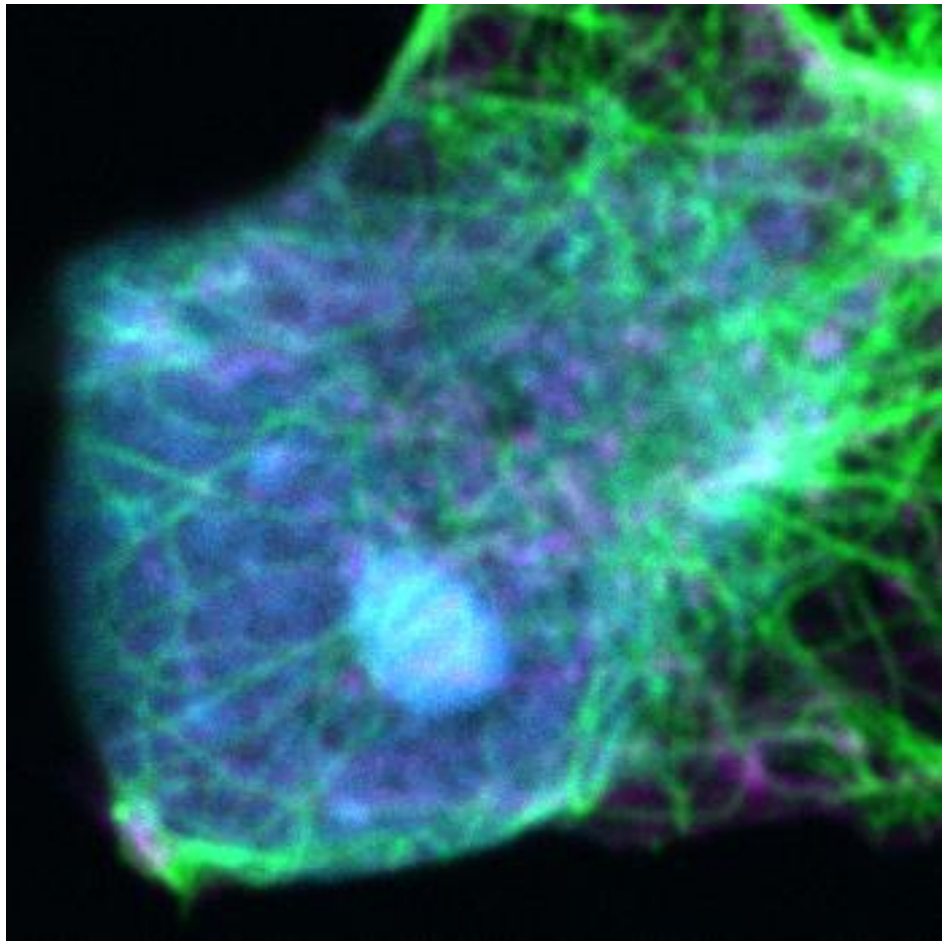


40x / 1.2 water

Higher NA + Immersion = Higher Resolution



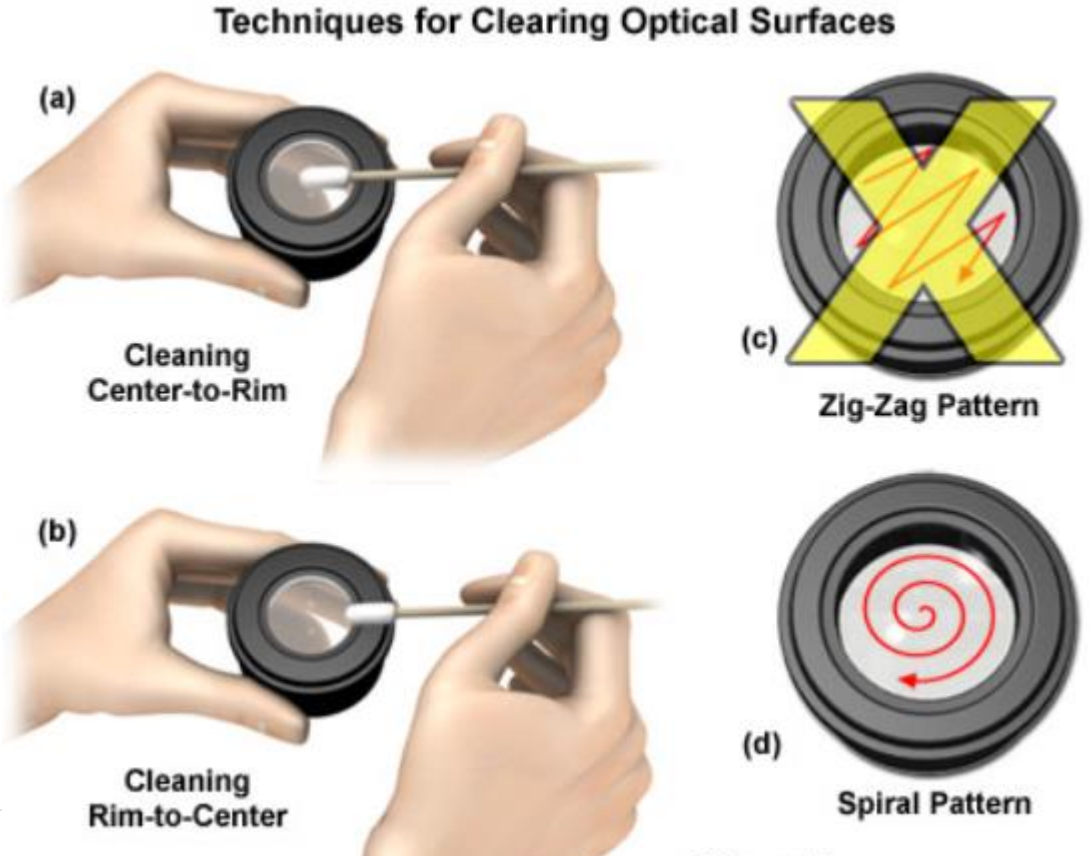
40x / 0.95 air



40x / 1.2 water

Immersion Objectives

Figure 4



Immersion & Refractive Index

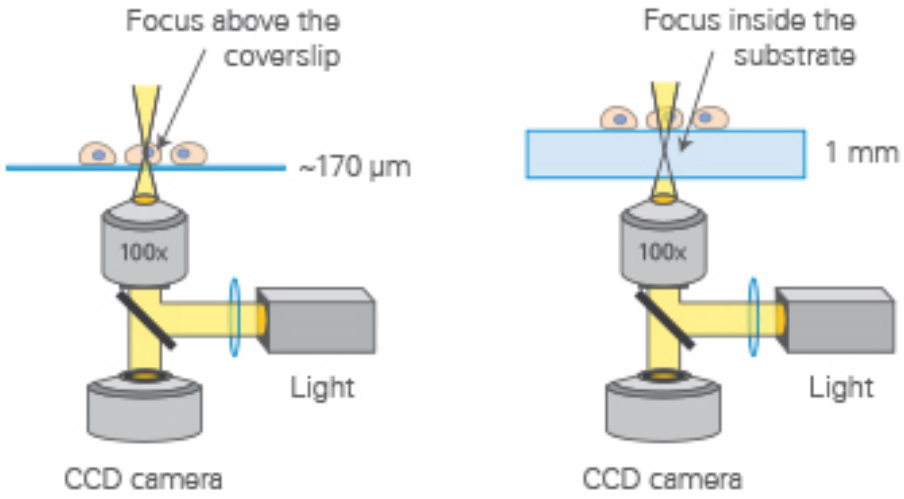
Sample objective only / might differ according to settings

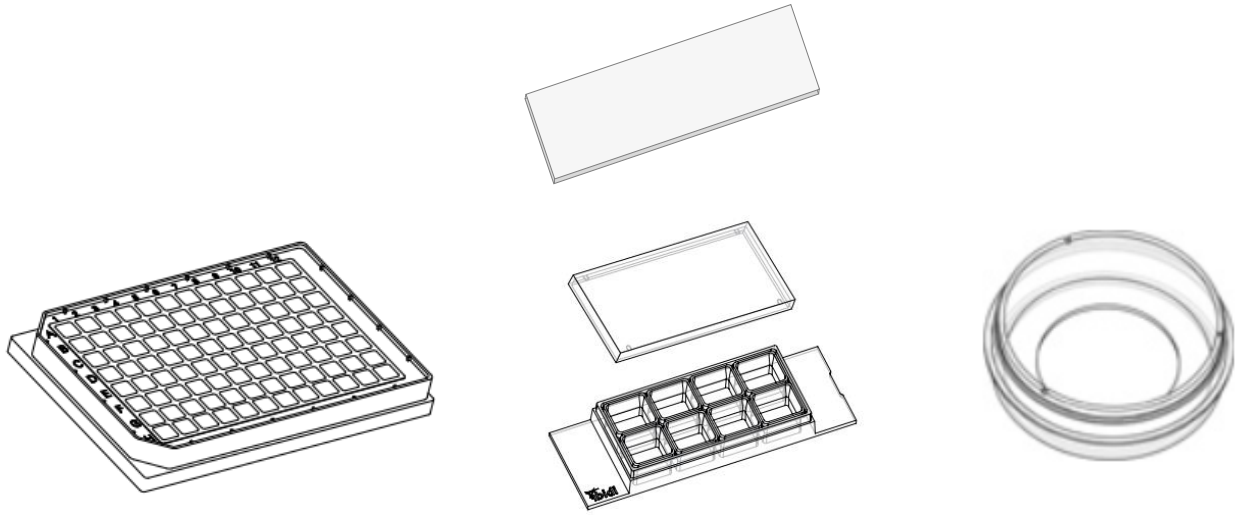
Mechanical Correction Collar

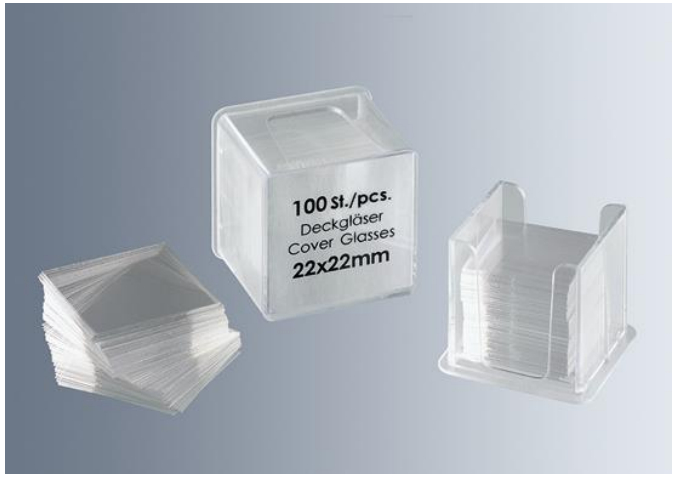
Cover glass thickness correction
Different Immersion (Oil, Glyc, Water)
Different Temperature
Adjusting an Iris Diaphragm

Multi-Immersion objectives (**L**ive **C**ell **I**maging-objectives) can be used when working with different immersion media (oil, glycerol, water)

Sample Carrier Thickness







Thickness no. 1 (0.13-0.16 mm)

Thickness no. 1.5 (0.16-0.19 mm)

Thickness no. 1.5H (0.165-0.175 mm)

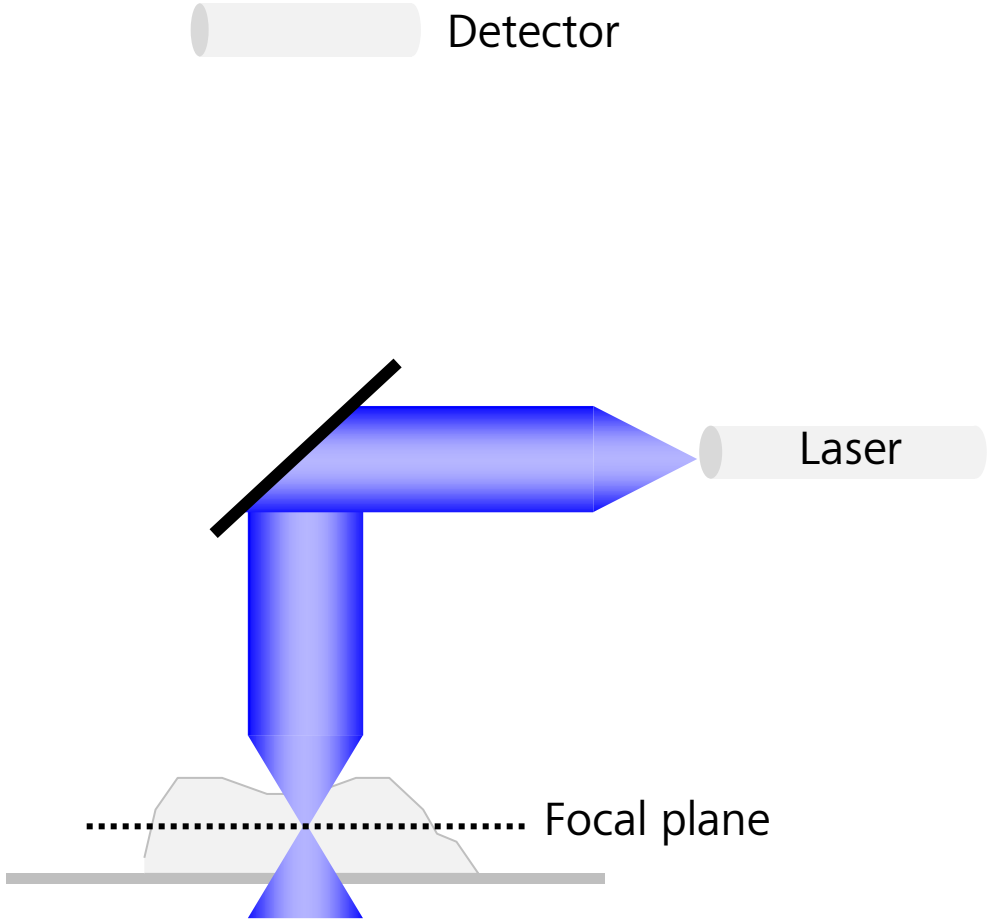
Point Scanning Confocal Microscopes

Confocal principle

Spot Illumination

A laser beam which is focussed to a diffraction limited spot illuminates the sample and is used for fluorescence excitation.

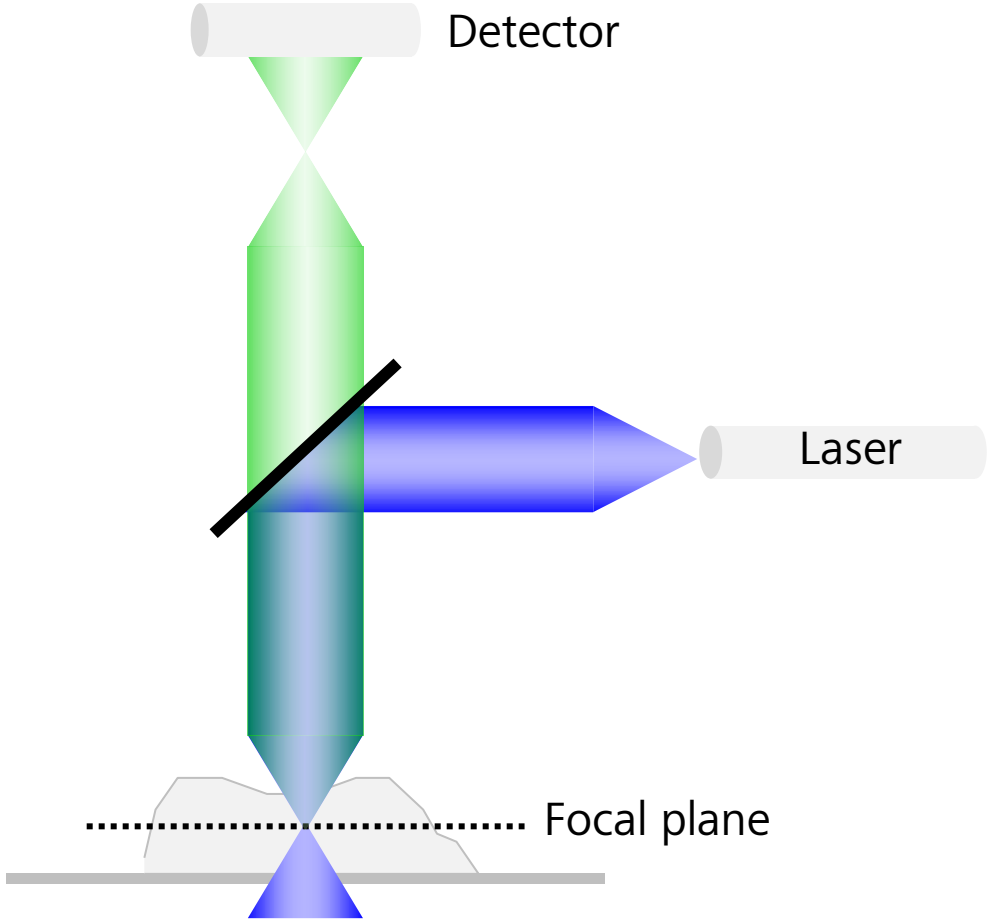


Point Scanning Confocal Microscopes

Confocal principle

Spot detection

The emitted fluorescence light is separated from the excitation light by appropriate beamsplitters and is usually detected by a photomultiplier.



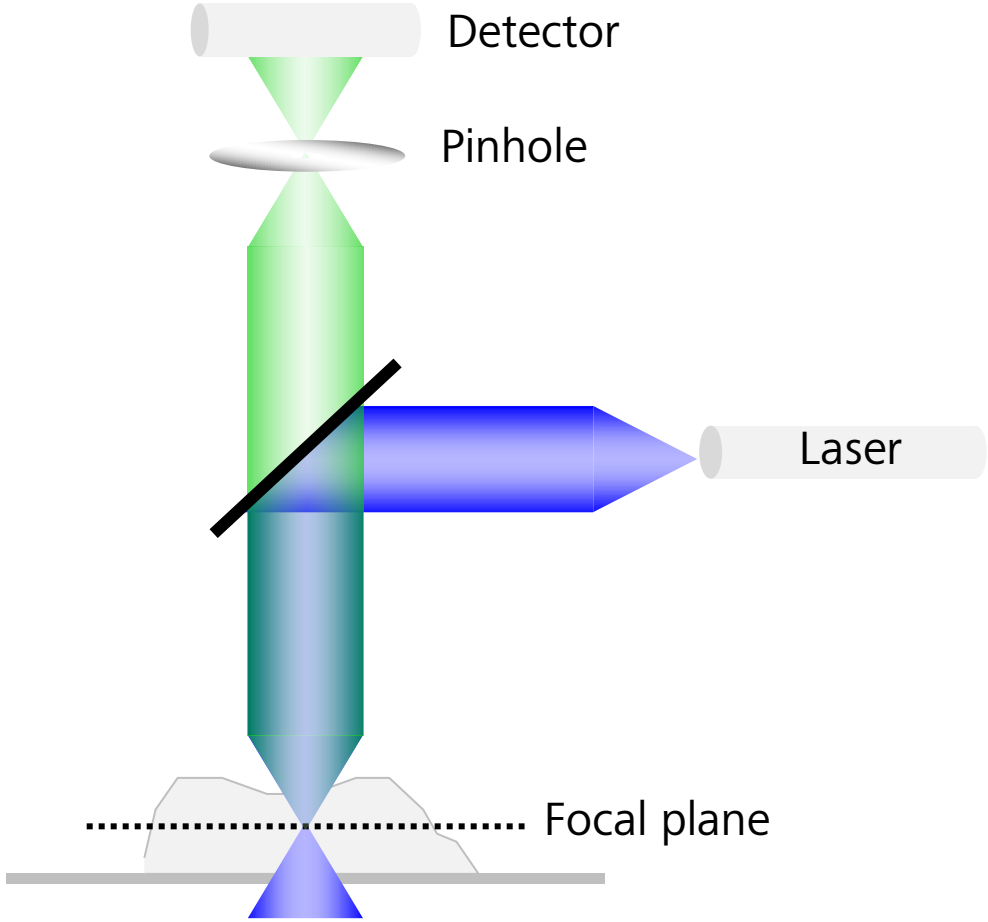
Point Scanning Confocal Microscopes

Confocal principle

Spot detection

The emitted fluorescence light is separated from the excitation light by appropriate beamsplitters and is usually detected by a photomultiplier.

The crucial part is the pinhole, which is placed in front of the detector – in a conjugated plane to the focal plane of the objective.

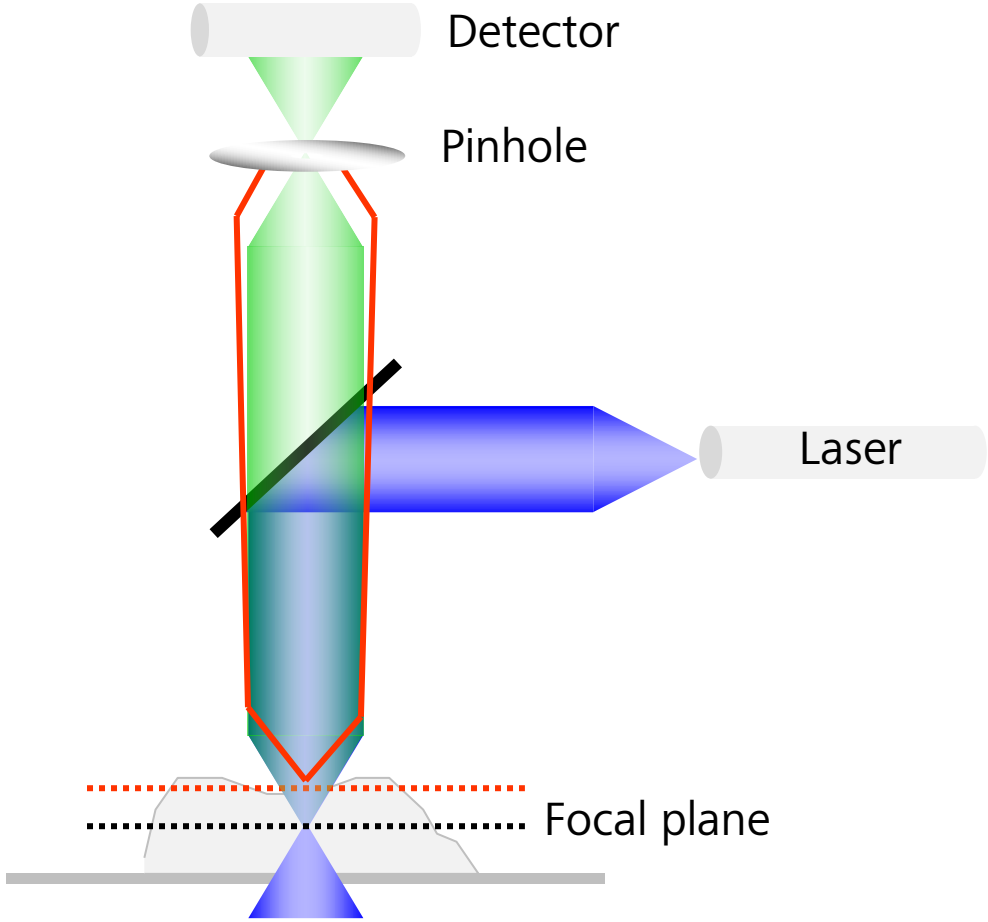


Point Scanning Confocal Microscopes

Confocal principle

Spot detection

This pinhole simply blocks fluorescence light, which originates from above or below the focal plane of the objective.

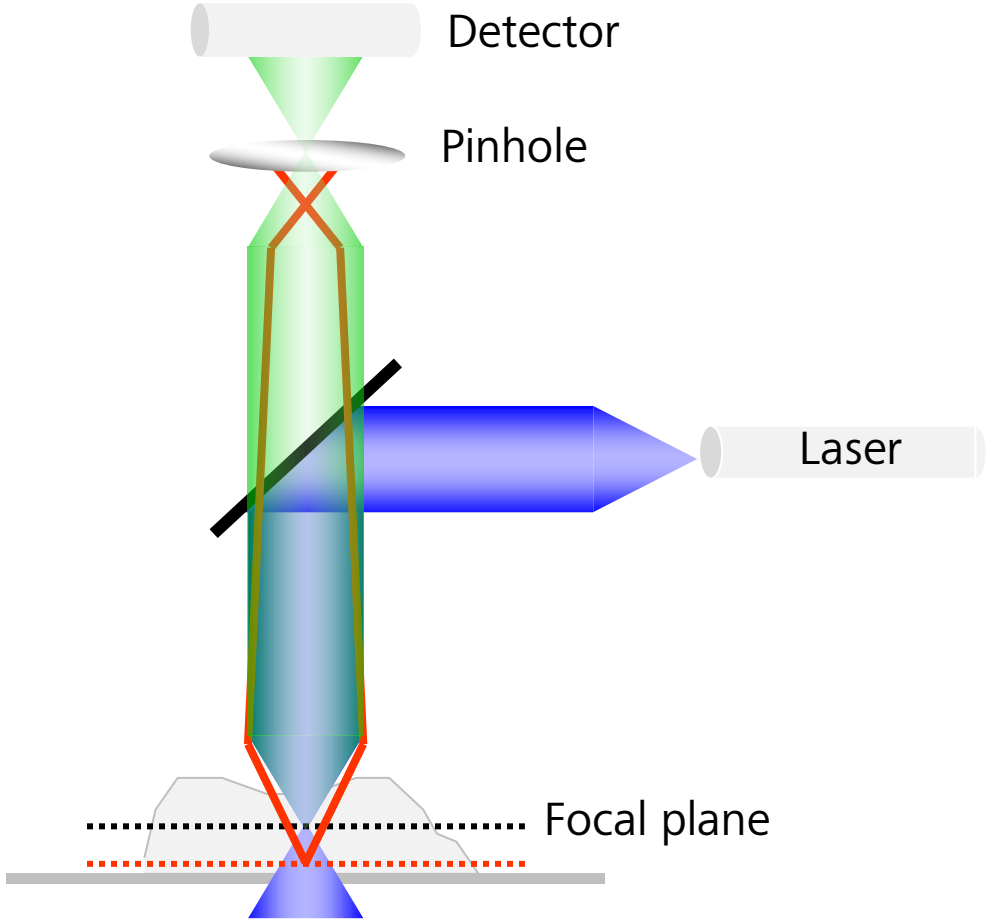


Point Scanning Confocal Microscopes

Confocal principle

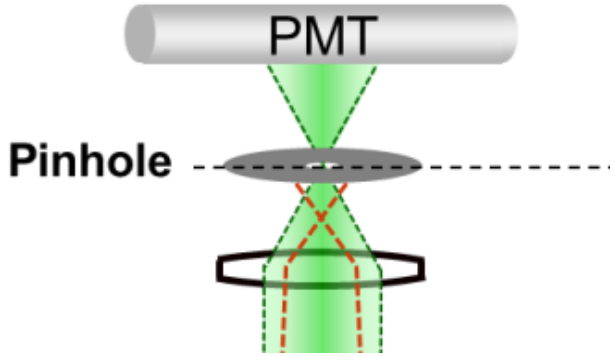
Spot detection

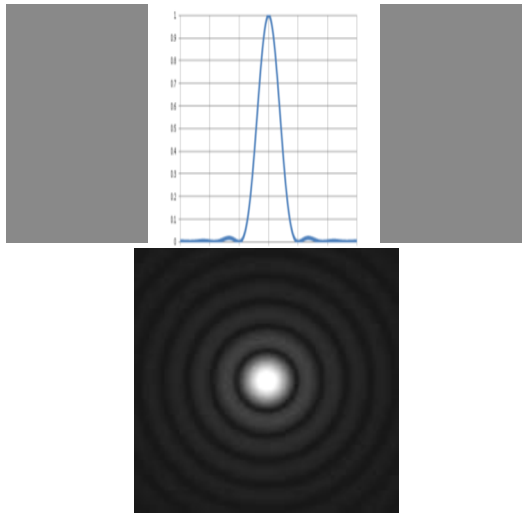
This pinhole simply blocks fluorescence light, which originates from above or below the focal plane of the objective.

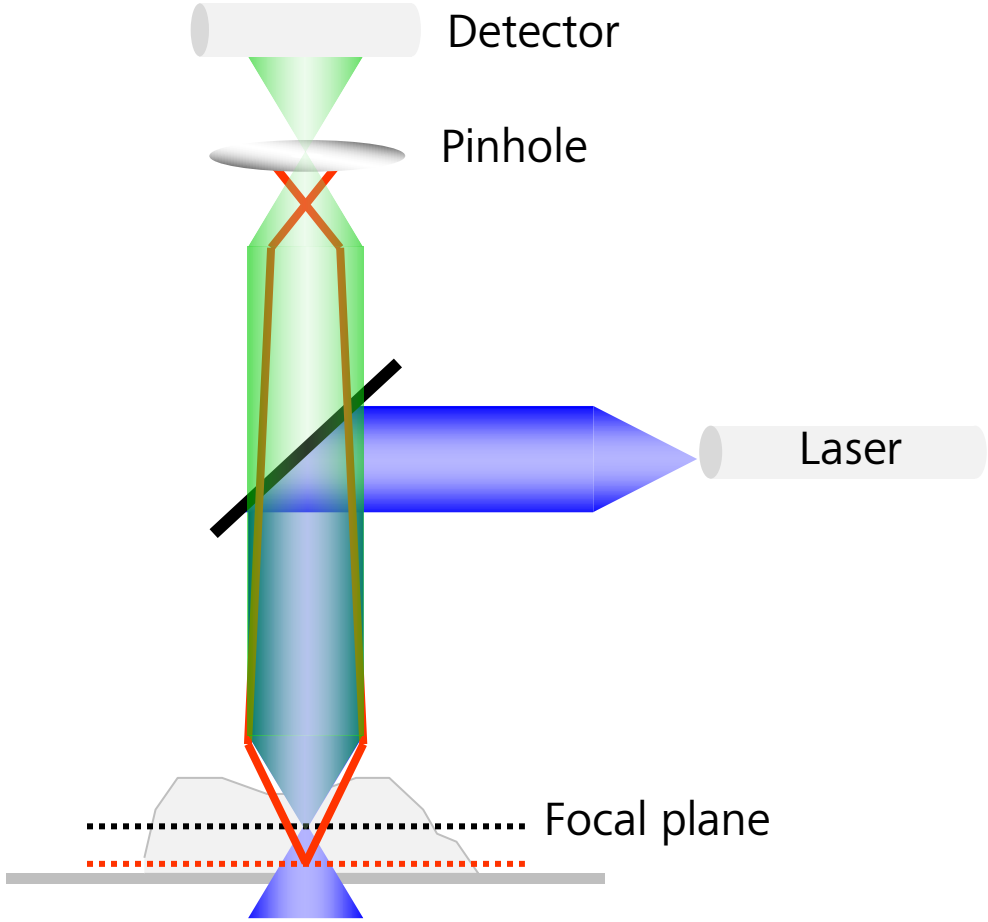


Point Scanning Confocal Microscopes

Confocal principle

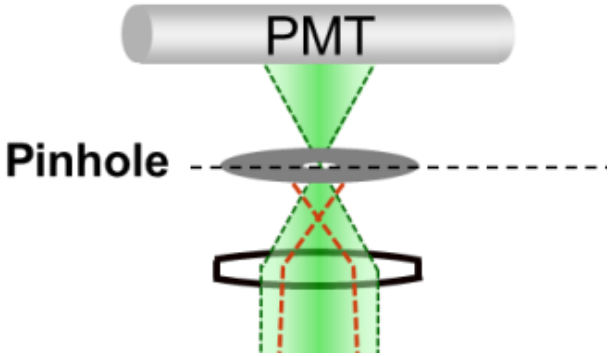


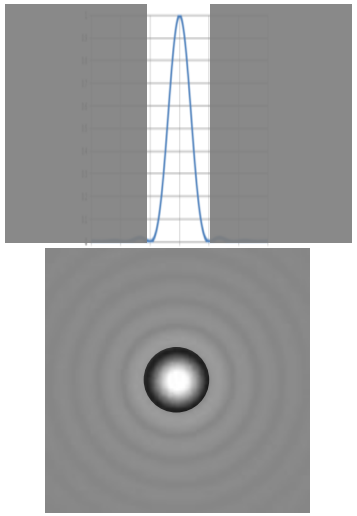


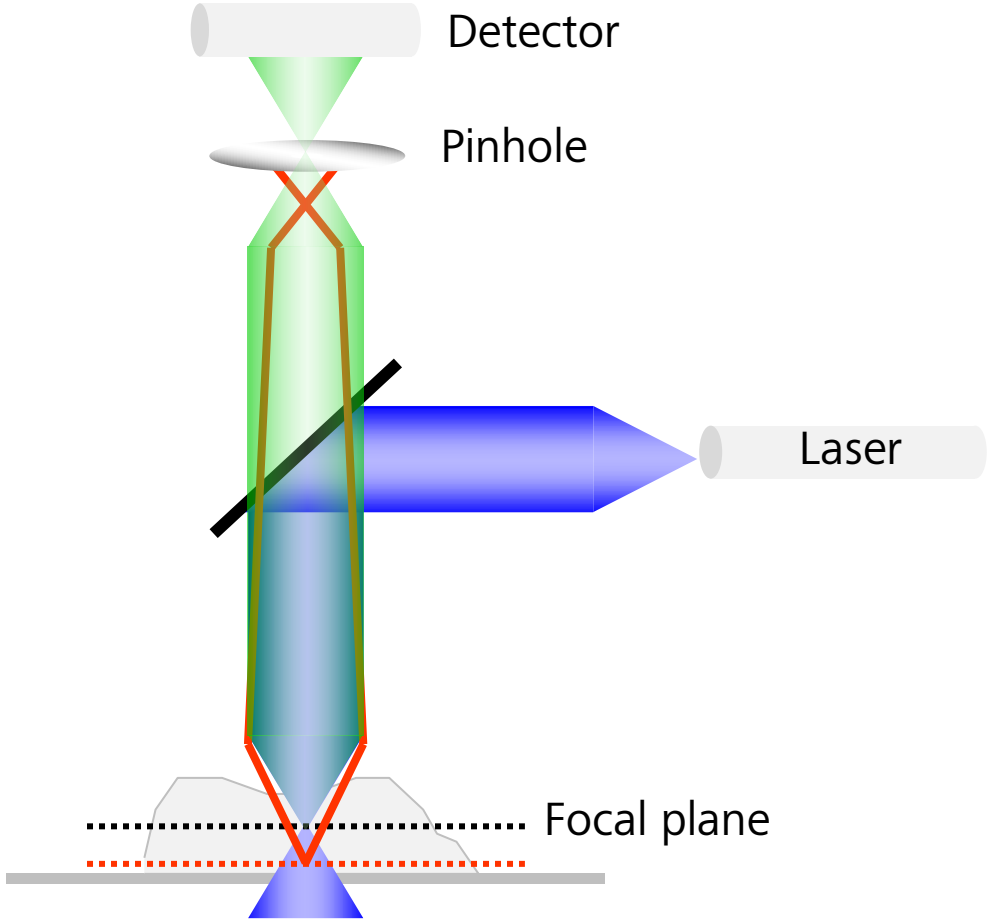


Point Scanning Confocal Microscopes

Confocal principle







From a Single Spot to a Complete Image

Spot Illumination Requires Two-dimensional Scanning

X-Y scanning

To generate a two-dimensional image, the laser spot is scanned in x and y direction to illuminate the whole field of view.

This is usually done by scanning mirrors.

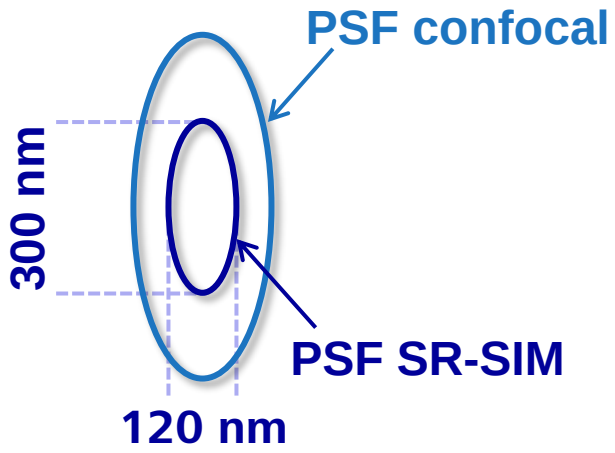
Structured Illumination Microscopy (SIM)
Technique summary

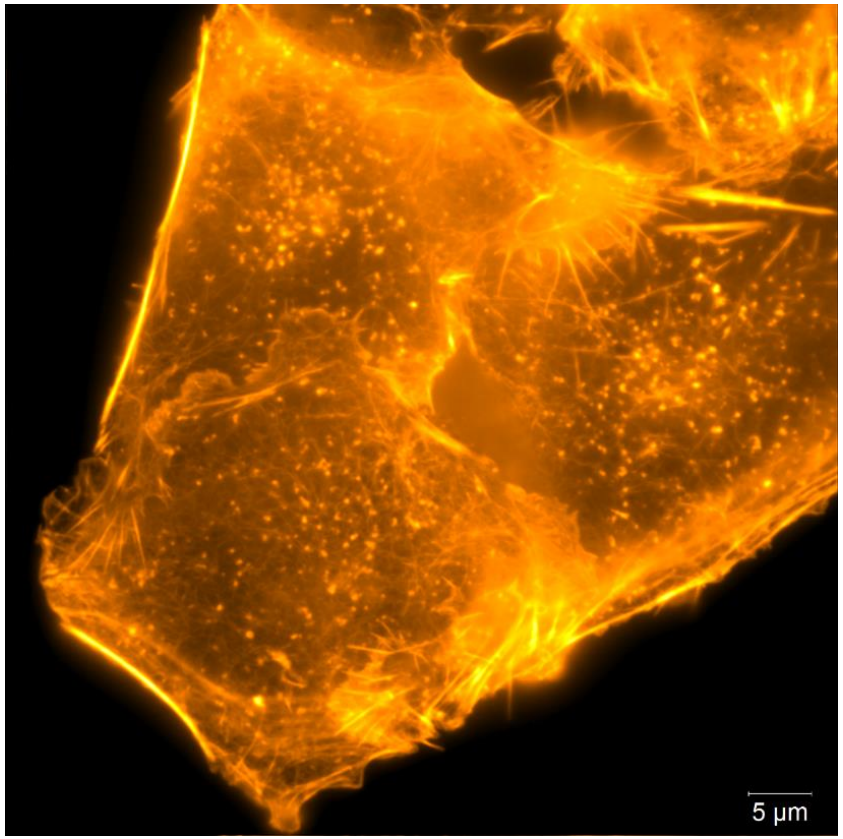
Principle

Uses interaction of grid pattern with sample to extract higher frequency information

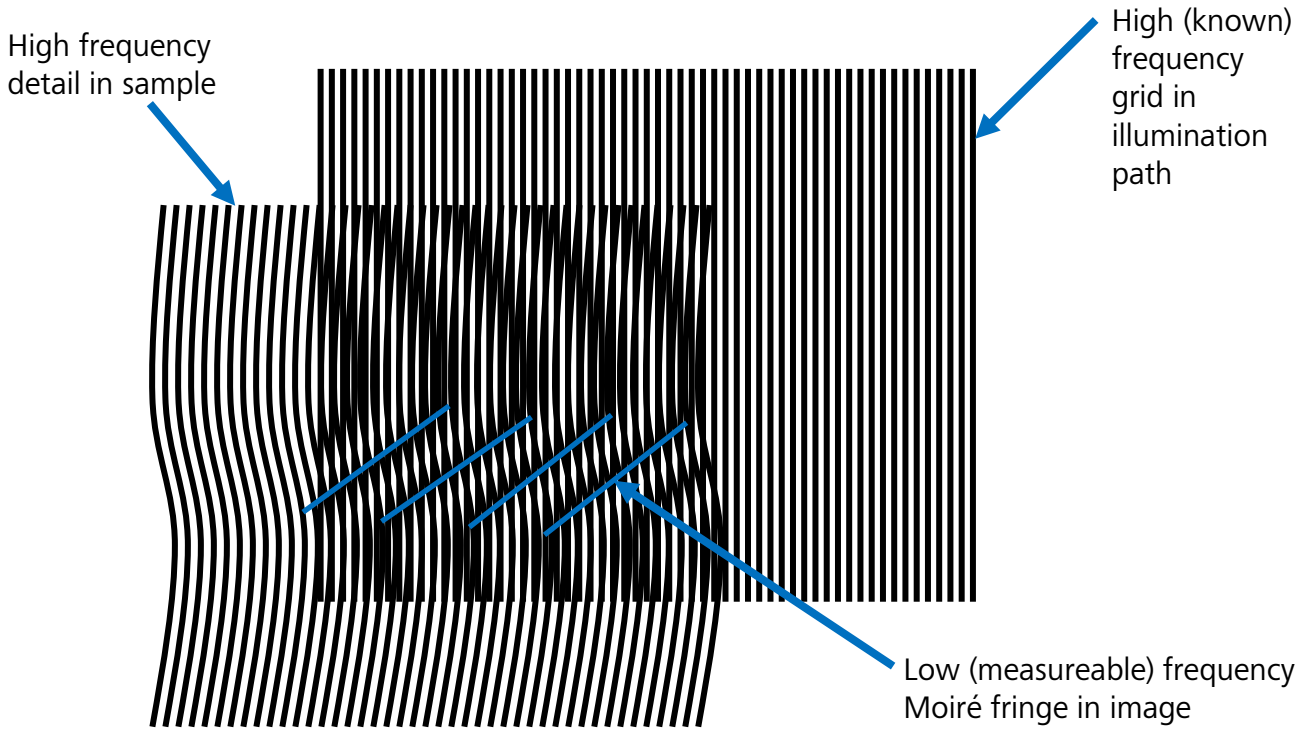
Advantages of SIM

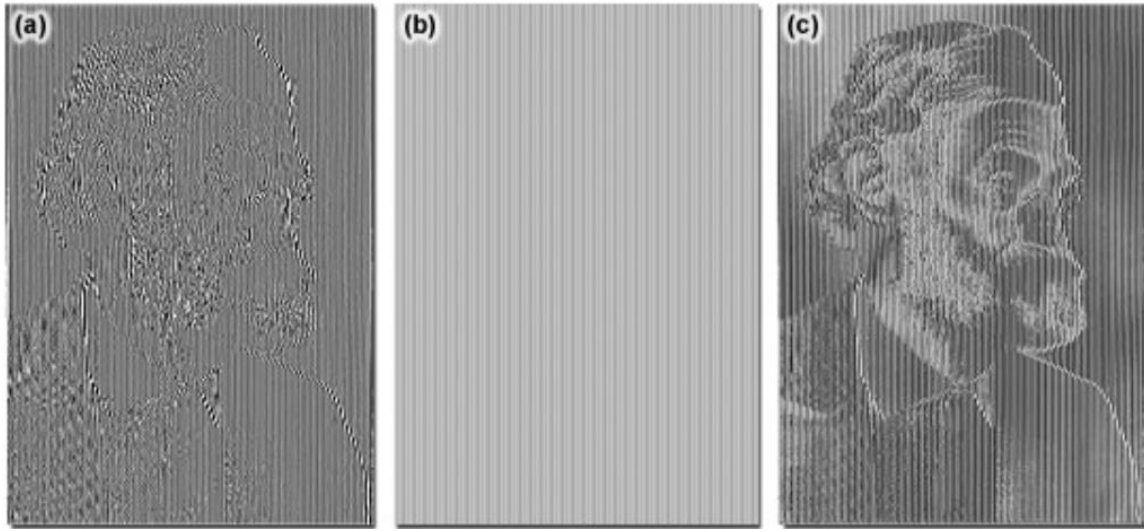
- Doubling of diffraction-limited resolution in 3D (120 nm in xy and 300 nm in z)
- Standard sample preparation
- Free choice of fluorophores
- Large field of view





Lattice Structured Illumination Microscopy
Changing the pattern – How does it work?





Utilizing high-frequency striped illumination to double the resolution

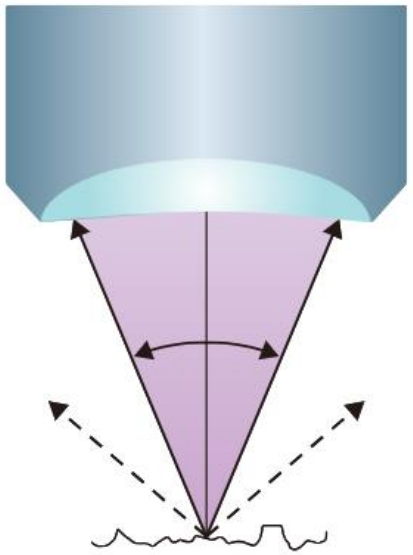


Fig. A: Resolution is limited by the NA of the objective

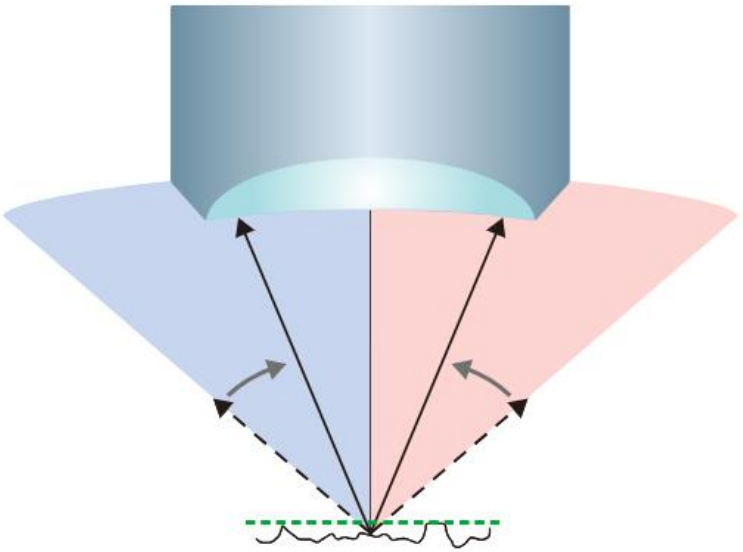

Fig. B: The product of Structured Illumination and normally un-resolvable specimen structure produce recordable moiré fringes containing the specimen information at double the conventional

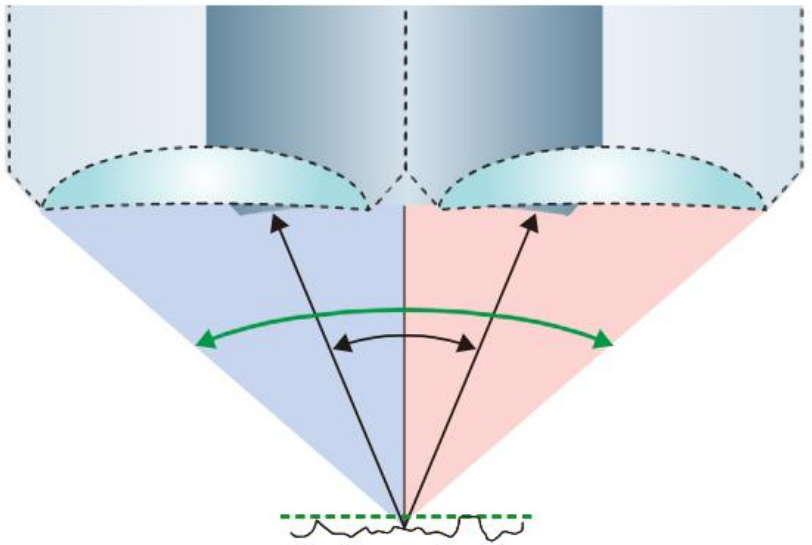

Fig. C: Images with resolutions equivalent to those captured with objective lenses with approximately double the NA are achieved.
